TestCodaTM from Simply Testing Ltd introduces a truly revolutionary way to build software test automation. **TestCoda** automatically generates the code which forms the basis of automated tests. Before **TestCoda**, testing tools had to be programmed manually (scripted) by automation specialists.

TestCoda's unique code generator dramatically cuts the cost of automated test script development, bringing industrial-scale automated regression testing within the reach of almost any software project. **TestCoda** doesn't replace automation tools such as WinRunner, Robot and QARun; it complements them by eliminating the manual writing of test scripts – the most expensive part of any automation project.

TestCoda eliminates the burden of hand-coding test scripts

It does this in two automated stages:

- 1 **TestCoda** analyses your system's user interface and builds a model of it automatically.
- 2 **TestCoda** generates the code for your tools (e.g. WinRunner, QARun, Robot, etc.), thereby vastly reducing your resource requirements.

TestCoda goes on to provide even more savings by greatly reducing the maintenance of automated tests. The code is regenerated for each new build of the system under test. **TestCoda** can even give impact analysis on

what has changed between builds.

Case Study

A Simply Testing client has an insurance system with over 900 windows. **TestCoda** can analyse the windows and generate all of the automation for the entire system – over 330,000 lines of WinRunner code – in only two hours! That's over 26 man-years of work by conventional methods! And because no test-tool knowledge is required, even end users are able to create automated tests.
